

ABSTRACT

A solid electrolytic capacitor (A1) includes a first and
5 a second anode terminals (11a, 11b) projecting in different
directions from each other. Preferably, a metal cover (22)
for electrically connecting the anode terminals (11a, 11b) to
each other is provided. With such an arrangement, the ESR and
the ESL can be reduced, and the high frequency characteristics
10 can be enhanced.
